

Documentation: Discount and Quantity Management in Shopping Cart

Overview:

The shopping cart on the website <https://magento.softwaretestingboard.com/> provides discounts on certain items based on their quantity. However, there are certain conditions to be considered when managing the quantity of items and adding new items with different color options.

Discount Management:

When a customer adds four or more of the same item to the shopping cart, a discount of 20% is applied to the total price of that item. For example, if a customer adds four Gwyn Endurance Tee Medium Green to the shopping cart, the total price for those four items will be discounted by 20%.

Quantity Management:

If a customer updates the quantity of an item in the shopping cart, the discount applied to that item may change. For example, if a customer initially adds four Gwyn Endurance Tee Medium Green to the cart, a 20% discount will be applied. However, if the customer later reduces the quantity of that item to three, the discount will be removed and the price for those three items will be calculated at the original price.

Adding Items with Different Colors:

If a customer adds an item with a different color option to the shopping cart, it will be treated as a new item and will not receive the same discount as the original item. For example, if a customer adds a Gwyn Endurance Tee Medium Green to the cart and later adds a Gwyn Endurance Tee Small Yellow, the yellow item will not receive the same discount as the green item, even if the total quantity of Gwyn Endurance Tee items in the cart is four or more.

Conclusion:

To summarize, the shopping cart on the website provides discounts based on the quantity of certain items. However, customers need to be aware of the impact of managing the quantity of items and adding new items with different color options on the applied discount. By keeping these conditions in mind, customers can effectively manage their shopping cart and take advantage of any applicable discounts.
